

1

Graph Top-20  $G_{20}(q)$ 

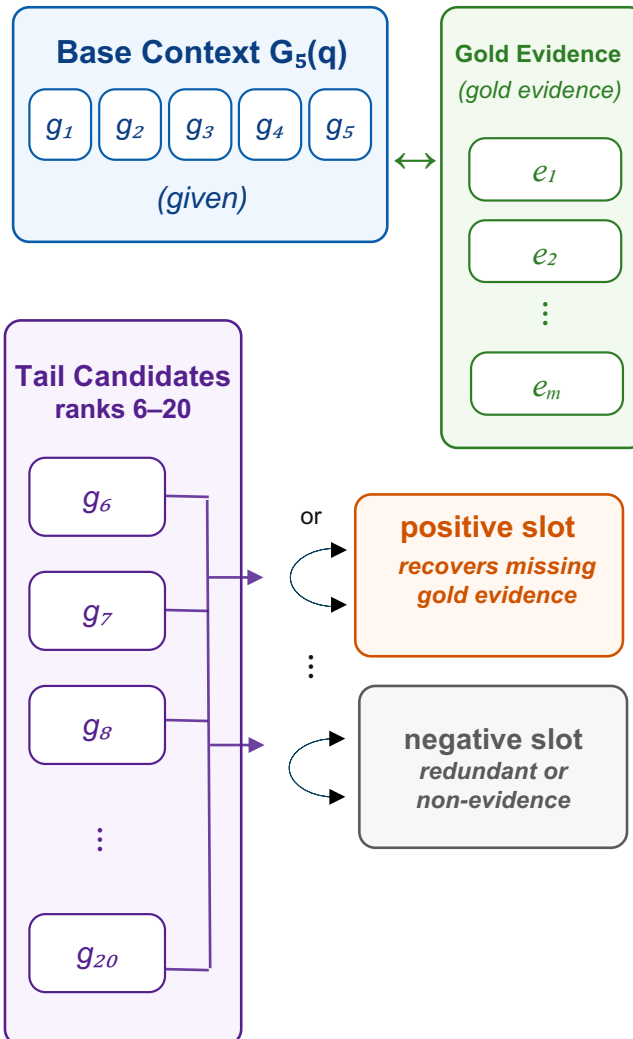

2

Base Context  $G_5(q)$ 

Labels depend on  
base context  $G_5(q)$

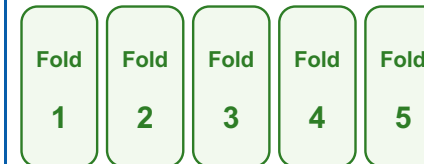

3

## Compare with Gold Evidence

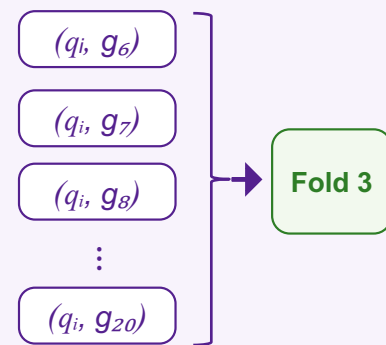

Positive slots are  
extremely sparse

4

Query-grouped  
OOF Training

all candidate slots from  
the same query stay in  
the same fold

Example: all slots from query  $q_i$   
go to Fold 3

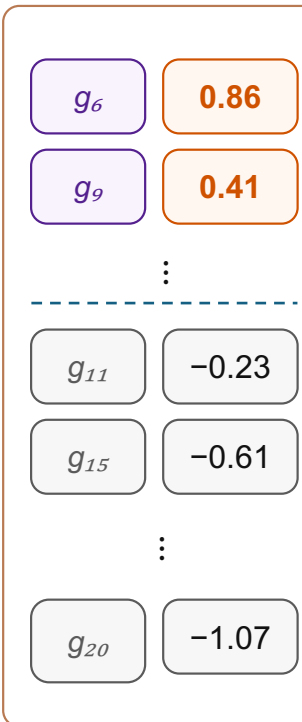

No query-level leakage

5

## Slot Allocator

predicts conditional  
marginal evidence gain

Input:  $(q, G_5(q), g_j)$   
(candidate slot  $j$ )

Output: score  $s_j \in \mathbb{R}$   
(higher is better)
